

Deployment Guide

Luna Beauty — Salon Booking Website Template

Recommended hosting: Vercel

This project is a Next.js application and can be deployed to Vercel without a database or server configuration. No environment variables are required by the current template.

Important pre-deployment checks

The original project contained an invalid **remotePatterns** protocol value. The buyer-ready source included with this package has been corrected to use **https** for `images.unsplash.com`.

The source package has also been aligned with the current Next.js 15 maintenance patch used in this delivery package.

1. Test locally

```
npm install
npm run build
npm run start
```

Confirm the production build succeeds before publishing the repository.

2. Create a GitHub repository

Create a new GitHub repository and push the project source. Do not upload **node_modules** or secret environment files.

```
git init
git add .
git commit -m "Initial commit"
git branch -M main
git remote add origin YOUR_REPOSITORY_URL
git push -u origin main
```

3. Import the project into Vercel

1. Sign in to Vercel.
2. Choose **Add New** → **Project**.
3. Import the GitHub repository.
4. Vercel should detect Next.js automatically.
5. Keep the default build settings.
6. Deploy.

4. Build settings

The project already uses the standard Next.js scripts.

```
Build Command: npm run build
Install Command: npm install
Start Command: npm run start
```

For Vercel, you normally do not need to set a custom output directory.

5. Environment variables

The current template does not require environment variables because the WhatsApp integration is generated in the browser and there is no backend or database.

6. Custom domain

After deployment, open the Vercel project and go to **Settings** → **Domains**. Add the customer's domain and follow the DNS instructions shown by Vercel.

Deployment & Troubleshooting

Images are not loading

Check that **next.config.ts** contains a remote pattern for images.unsplash.com using the **https** protocol. If you replace the remote images with local images, place them inside **public/** and use local paths.

```
images: {
  remotePatterns: [
    {
      protocol: "https",
      hostname: "images.unsplash.com",
    },
  ],
}
```

WhatsApp opens the wrong number

Check the **WHATSAPP_NUMBER** constant in **components/SalonPage.tsx**. Use international format without the plus sign.

WhatsApp does not open

The template uses a standard wa.me link. The user's device/browser needs to have WhatsApp or WhatsApp Web available. The booking form itself does not send a message through an API.

Vercel build fails

Run the production build locally first:

```
npm run build
```

Read the first TypeScript or configuration error in the terminal. Fix local build errors before redeploying.

Security / dependency maintenance

Keep Next.js and other dependencies updated. Next.js publishes supported Active and Maintenance LTS releases and security patches. The included source uses the current 15.x maintenance patch at the time this package was prepared.

Production checklist

- Replace demo business name
- Replace WhatsApp number
- Replace address and opening hours
- Replace services and prices
- Replace all demo images
- Replace testimonial
- Replace social links
- Check mobile layout
- Test booking form

- Test WhatsApp link
- Run npm run build
- Deploy to Vercel
- Test the live URL
- Connect custom domain if required
